Introduction

3

In this work the ninth part of my studies of the fishes of the Albatross collections are concluded. It deals with the more or less aberrant groups of Geoidae, Berycoidei and Thoracostei, besides the more generalized Percomorphi as represented by the Percosoces and Rhegnopteri. Most of the localities are included in the Philippines, though others represented by smaller series of specimens are from the Netherlands Indies, China, Formosa and Oceania. As in the preceding volumes the remarks there given apply largely here, especially the acknowledgements.
